#### **Unit Overview and Guidance**

- The exemplification has been taken from the NCETM online 'Resource Toolkit', with additions in order to ensure full coverage.
- Links to the White Rose Maths hubs schemes of work (with questions categorised into the three aims of the national curriculum i.e. fluency, problem solving and reasoning) are hyperlinked to each of the objectives. Many thanks go to the White Rose Maths hub for permission to include their resources.
- The NCETM reasoning questions have also been incorporated into each unit and are identified in pale purple boxes underneath the group of the most relevant objectives.
- The 'big Ideas' sections from the NCETM 'Teaching for Mastery' documents have been included at the start of each unit. Hyperlinks to the full NCETM 'Teaching for Mastery' documents have also been included for easy reference.
- Hyperlinks to NRich activities have also been added to this version. These are found by clicking on the blue buttons like this one
- Some additional content has been added in order to support mixed-aged planning. Any additional content is in *italics*. Occasionally strikethrough has been used to identify when an objective has been altered and this is primarily where an objective has been split between two units.
- Each unit is sub-divided into sections for ease of planning. Sub-categories in this unit are;

1. Properties of shapes

2. Angles

#### 3. Position, direction and movement

	Yr 2	Yr 3	Yr 4
NCETM Teaching for Mastery estions, tasks and activities to support assessment	The Big Ideas         It is not uncommon for pupils to say that this is a square         and this is not       , or that something like this is a triangle         and this is not       , or that something like this is a triangle         A.       .         It is important for pupils to know what the properties are that make up certain shapes, and for them not to just learn the names of typical proto looking shapes.         It is helpful to think about non examples of shapes. For         example, why this is not a triangle:         Recognising pattern and generalising structures and relationships are key elements for laying the foundations for later work in algebra.	<ul> <li>The Big Ideas</li> <li>During this year there is an increasing range of shapes that pupils are familiar with. The introduction of symmetrical and non-symmetrical polygons and the requirement that pupils should be able to draw them will give rise to discussions about lengths of sides and sizes of angles. Pupils need to appreciate these features as properties of shapes as well as the number of sides and vertices.</li> <li>Pupils recognise that angles are about the amount of turn – the lengths of the lines used to represent angles do not affect the size of the angle.</li> <li>Pupils recognise that relationships are at the heart of properties of shapes, not particular measurements. For example, the opposite sides of any rectangle will always be equal, not that rectangles have a pair of long sides and a pair of short sides.</li> </ul>	The Big Ideas During this year, pupils increase the range of 2-D and 3-D shapes that they are familiar with. They know the correct names for these shapes, but, more importantly, they are able to say why certain shapes are what they are by referring to their properties, including lengths of sides, size of angles and number of lines of symmetry. The naming of shapes sometimes focuses on angle properties (e.g. a rectangle is right-angled), and sometimes on properties of sides (e.g. an equilateral triangle is an equal sided triangle). Shapes can belong to more than one classification. For example, a square is a rectangle, a parallelogram, a rhombus and a quadrilateral.
