

# **Topic 4**

## **Data Types, Data Structures and Algorithms**

1(a)

A computer scientist has created the following logic circuit shown in Fig. 6.

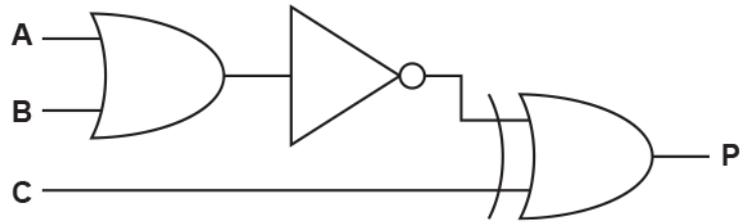

Fig. 6

(i) Give the Boolean expression that represents the logic circuit shown in Fig. 6. Do not attempt to simplify the expression.

-----

-----

-----

-----

[2]

(ii) Complete the truth table for the logic circuit shown in Fig. 6.

A	B	C	P
0	0	0	
0	0	1	
0	1	0	
0	1	1	
1	0	0	
1	0	1	
1	1	0	
1	1	1	

[3]

(b) The following Karnaugh map represents another logic circuit.

		AB			
		00	01	11	10
CD	00	1	1	1	1
	01	1	1	0	0
	11	0	0	0	0
	10	0	0	1	1

Use this Karnaugh map to find the simplified expression for this circuit.

You should highlight the map as appropriate and write the expression here.

-----

-----

-----

-----

[4]

2(a)

(i) Convert the denary number **189** to hexadecimal.

-----  
-----  
-----  
-----

[1]

(ii) Convert the unsigned binary number **1010101111** to hexadecimal.

-----  
-----  
-----  
-----

[1]

(b) Negative binary values can be represented using either sign and magnitude or two's complement.

(i) Convert the denary number **-107** to an 8-bit binary number using sign and magnitude.

-----  
-----  
-----  
-----

[1]

(ii) Convert the denary number **-107** to an 8-bit binary number using two's complement.

-----  
-----  
-----  
-----

[1]

(iii) Give **one** advantage of storing values using two's complement instead of sign and magnitude.

-----  
-----

[1]

3(a) Sundip writes an algorithm to carry out addition and subtraction. The algorithm will use an initially empty stack with the identifier `numbers` and will take input from the user.

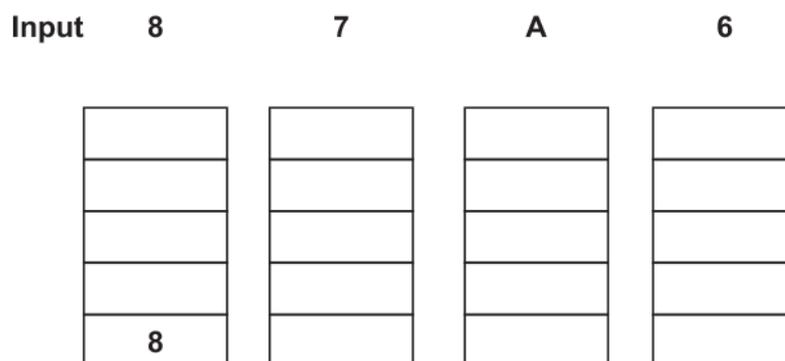

The action the algorithm takes depends on the value input by the user. These actions are listed in Fig. 2.

Value input	Action to take
<b>A</b>	<ul style="list-style-type: none"> <li>• Pop two values from the <code>numbers</code> stack</li> <li>• Add the two values</li> <li>• Push the result back onto the <code>numbers</code> stack</li> </ul>
<b>S</b>	<ul style="list-style-type: none"> <li>• Pop two values from the <code>numbers</code> stack</li> <li>• Subtract the first popped value from the second</li> <li>• Push the result back onto the <code>numbers</code> stack</li> </ul>
<b>E</b>	<ul style="list-style-type: none"> <li>• Pop one value from the <code>numbers</code> stack</li> <li>• Output this value</li> <li>• End program</li> </ul>
<b>Any other value</b>	<ul style="list-style-type: none"> <li>• Push the input value to the <code>numbers</code> stack</li> </ul>

Fig. 2

(i) Complete the diagram to show the state of the stack after each value is entered into the algorithm. The letters will complete an action stated in Fig. 2.

The state of the stack after the first value, 8, has been completed for you.

[3]

(ii) Complete the following table to give the output from this algorithm when the following set of inputs are entered by the user. The letters will complete an action stated in Fig. 2.

Input data (from left to right)	Output
9 3 A E	
10 5 A 8 S E	
25 5 S 2 3 A S E	

[3]

(iii) If the user enters 4 2 S A E , the algorithm will not work correctly.

Explain what problem this input data will cause and why the problem occurs.

-----

-----

-----

-----

-----

-----

-----

[3]

(b) A stack is one data structure that is available for Sundip to use. She could also use a queue, list, linked list, array or tuple.

(i) Describe **one** difference between a stack and a queue.

-----

-----

-----

[2]

(ii) Describe **one** difference between an array and a list.

[2]

(iii) State **how** a tuple is different to a list.

[1]

(iv) Describe how the **second** item in a linked list would be accessed using pointer values.

[3]

4 State the benefit of using a normalised form when representing data as a floating point number.

[1]

5(a) A programmer uses a queue data structure to store data.

(i) Tick **one** box that describes how a queue operates.

Last In First Out

First In First Out

[1]

(ii) The figure below shows a queue data structure that contains a list of names. Alex is at the front of the queue.

The operations that can be used on the queue are:

- `enqueue()` – This will add data that is passed in as a parameter to the queue.
- `dequeue()` – This will return the first element in the queue.

Show the contents of the queue after these operations have been performed:

```
enqueue("Charlie")
dequeue()
enqueue("Ling")
dequeue()
enqueue("Sara")
```

[2]

(b) A stack is a type of data structure.

A stack is implemented using these variables:

- `items` – This is used to store an array that contains the data.
- `top` – This is an integer value pointing to the last item of data that was inserted.

`pop()` is one operation that can be performed on a stack. This will remove an item from the top of the stack, or `-1` if the stack is empty.

(i) Complete the pseudocode function for the `pop()` operation.

```
function pop()

    if top == ..... then

        return -1

    else

        item = items[.....]

        top = top - .....

        return .....

    endif

endfunction
```

[4]

(ii) A function called `reverse` uses a stack called `theStack` to reverse data that is passed in as a parameter called `name`. For example, the name “Jack” would be returned as “kcaJ” by the function.

`theStack` uses these operations which are already defined as global scope in the program:

- `push()` – This will add data that is passed in as a parameter to the stack.
- `pop()` – This will remove and return the item on top of the stack.

Write the function `reverse` so that it:

- accepts the `name` as a parameter

-----

-----

-----

-----

-----

[7]

6 Describe what is meant by the term 'character set'.

-----

-----

-----

-----

[2]

- 7 Fig. 5 shows a graph data structure representing a small section of a parcel delivery network. Each node represents an address where deliveries need to be made. The edges show the possible routes and distances between these deliveries.

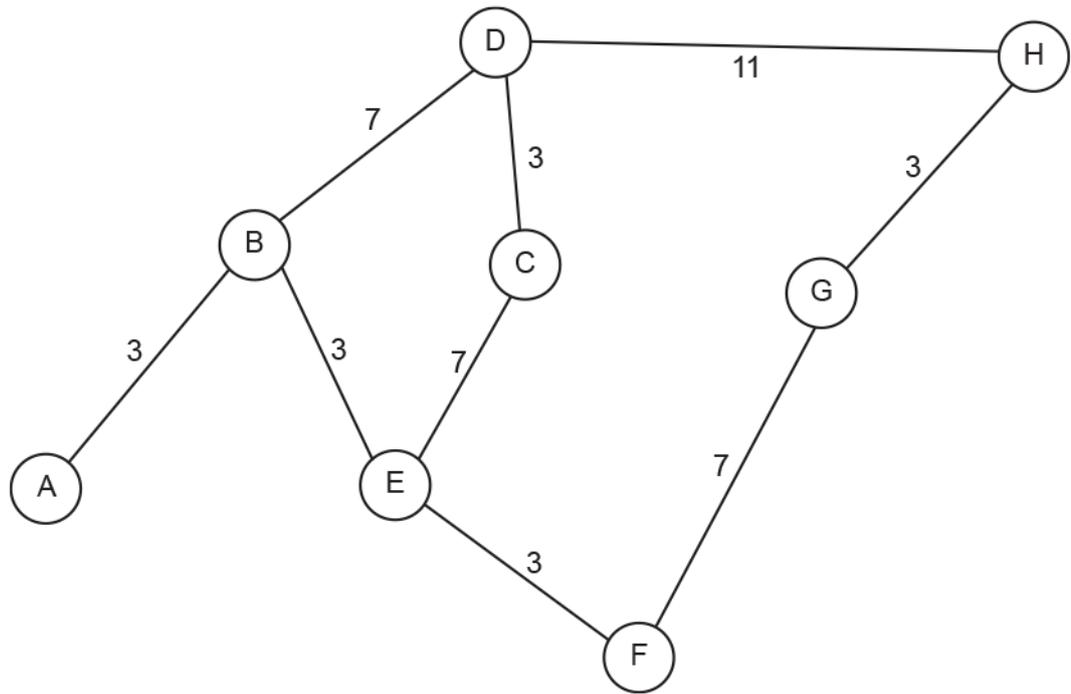

Fig. 5

Give **one** reason why the graph is a visualisation of the problem.

-----

-----

[1]

- 8 Give **one** benefit and **one** drawback of declaring an array as a global variable instead of a local variable.

Benefit -----

-----

Drawback -----

-----

[2]

11(a Elliott has designed a logic circuit. The expression he has created for the logic circuit is:  
)

$$Q = (A \wedge \neg B) \vee (\neg A \wedge C \wedge D) \vee (A \wedge B)$$

Complete the Karnaugh Map below to simplify this expression. Show your working.

		AB			
		00	01	11	10
CD	00				
	01				
	11				
	10				

Simplified expression:

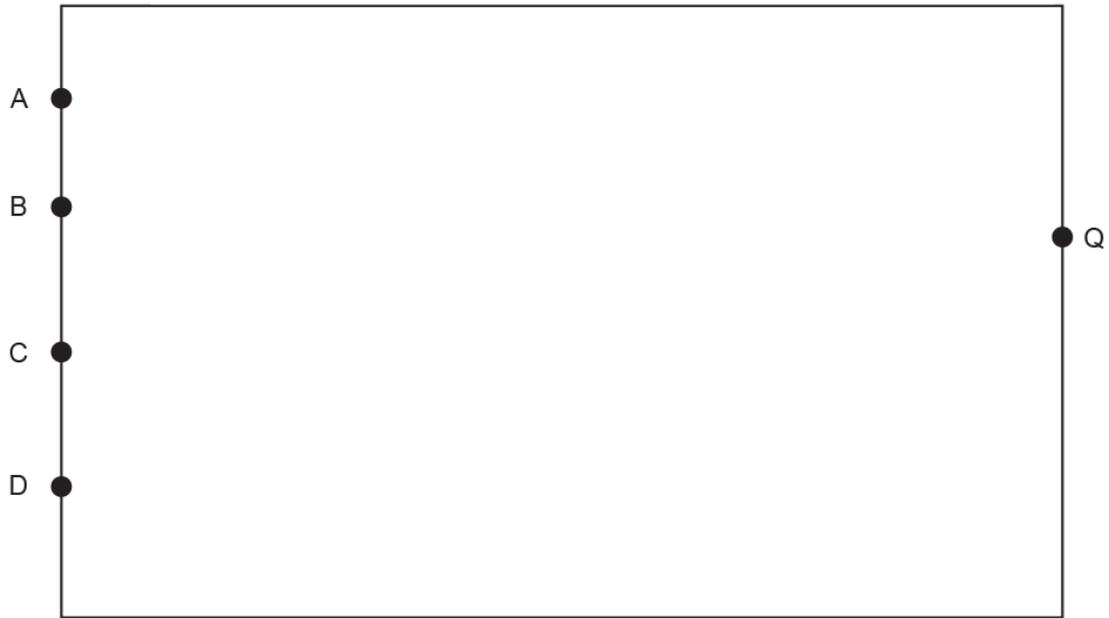

-----

-----

[4]

(b) Draw a Logic diagram for the following expression:

$$Q = \neg(A \wedge B) \vee (C \wedge \neg D)$$

[3]

12 Draw an XOR gate.

[1]

13 The two below are stored using unsigned binary. Calculate the subtraction of 01110010 from 11000011. Show your working.

$$\begin{array}{r}
 11000011 \\
 - 01110010 \\
 \hline
 \\
 \hline
 \end{array}$$

[2]

14(a A business uses an array with the identifier `wNames` to store workers' names. A variable with the identifier `top` is used to store the index of the last element to be added to the array, which is also the element which will next be removed.

wNames

0	1	2	3	4	5	6
Kirstie	Martyn	Louise	Alex	Anna		

top

4
---

- (i) State the name of the type of data structure described above.

[1]

- (ii) Using pseudocode, write an algorithm that allows the user to enter a name which is then pushed onto the data structure above, checking first that the data structure is not full.

[4]

-----  
-----  
----- [2]

(iv) Compare the efficiency of a binary search tree to a hash table when searching for data.

-----  
-----  
----- [2]

15(a All users of a computer system have a unique username and password. The computer system has implemented two-factor authentication so that users must respond to either an email or text message containing a secret code to be able to access the system.

Let:

$A$  be a Boolean value for if a user enters a valid username

$B$  be a Boolean value for if a user enters a password that matches their username

$C$  be a Boolean value for if a user is able to respond to an email containing a secret code

$D$  be a Boolean value for if a user is able to respond to a text message containing a secret code

$Q$  be a Boolean value for if entry to the computer system is allowed

Complete the Boolean expression below:

$Q \equiv$  -----

(b) Another Boolean expression for a logic system is shown below:

$$Q \equiv \neg (\neg A \wedge \neg B)$$

(i) Simplify this Boolean expression so that it does not include any negation. You must explain which Boolean algebra rule(s) you are using at each step.

-----

-----

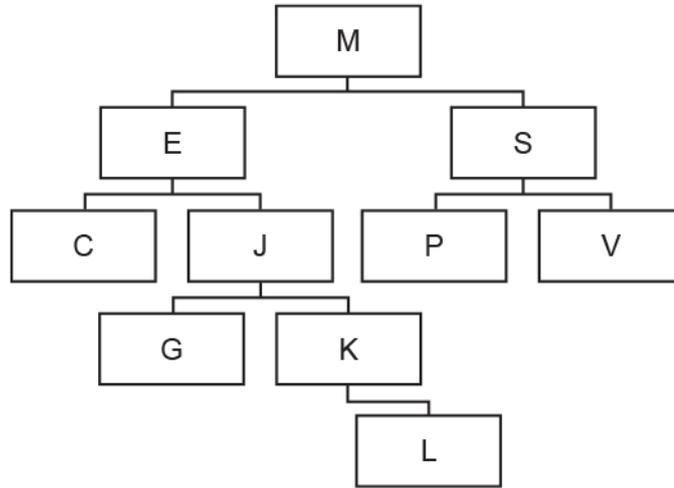

-----

-----

[2]

16 A breadth-first traversal can be performed on both a tree and a graph.

Show how a breadth-first traversal is performed on the following binary tree.

-----

-----

-----

-----

-----

-----

[6]

17(a Kira is creating a computer game where the user can play against the computer.

)  
In each turn, each character can make one move from a selection of possible moves.

Kira uses a tree data structure shown in Fig. 1 to identify the range of possible moves the computer can make from starting position A. Each connection is a move, with each node representing the result of the move.

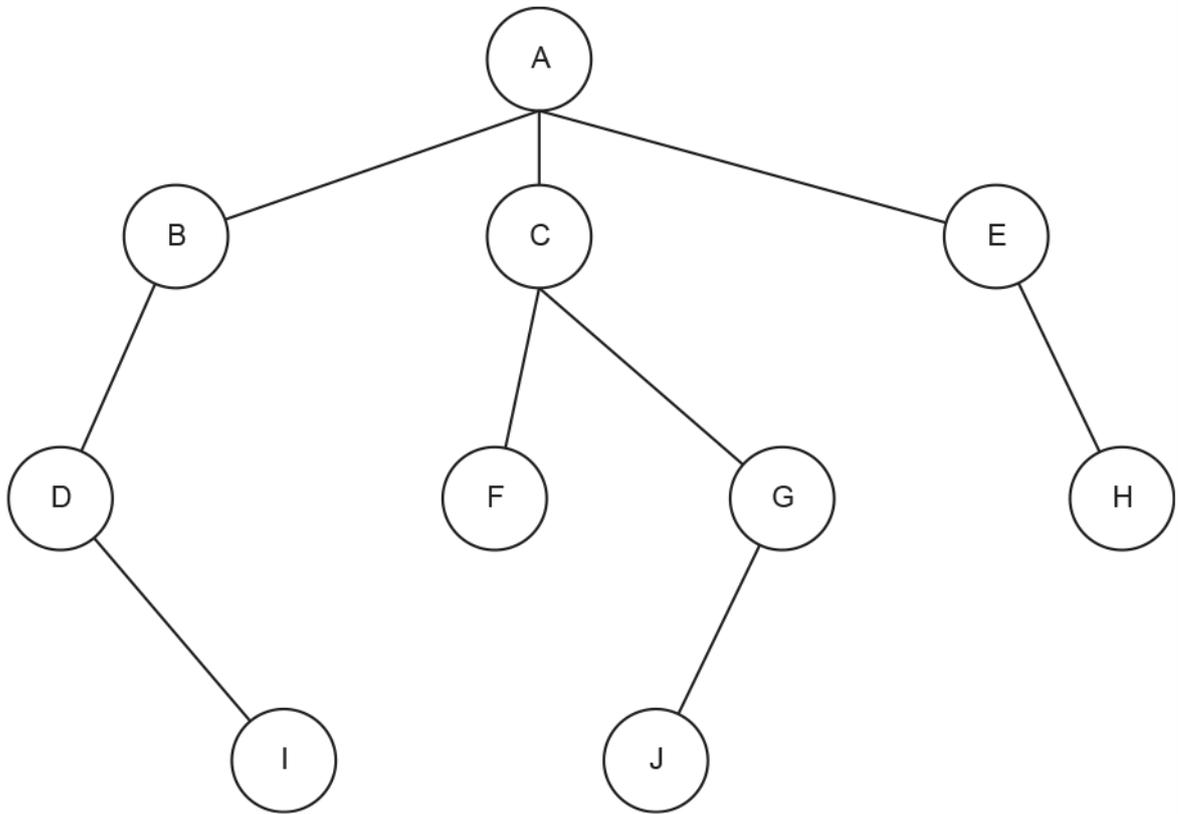

Fig. 1

Kira wants to make some changes to the data that is stored in the tree structure shown in Fig. 1.

(i) The move represented by node 'E' needs to be deleted.

Describe the steps an algorithm will follow to delete node 'E' from the tree.

-----

-----

-----  
-----  
-----  
----- [3]

(ii) The move represented by the node 'K' needs to be added. Node 'K' needs to be joined to node 'G'.  
Describe the steps the algorithm will follow to add node 'K' to the right of node 'G'.

-----  
-----  
-----  
-----  
-----  
----- [3]

(b) State why the tree shown in Fig. 1 is not an example of a binary search tree.

-----  
----- [1]

(c) State what type of pointers are used to store nodes I, F, J and H so they do not point to any other nodes.

-----  
----- [1]

(i) Show the result of applying an XOR mask of 1100 0111 to the byte 0101 1101.

Byte            **0101 1101**

XOR mask    **1100 0111**

[2]

(ii) Describe a mask that could be applied to an 8-bit number to ensure that:

- the most significant bit is always set to 1
- all other bits remain unchanged.

-----

-----

-----

-----

[2]

(i) State the purpose of a D-type flip-flop circuit.

-----  
-----  
-----  
-----

[2]

(ii) Describe the inputs and outputs used by a D-type flip-flop circuit, explaining how the inputs are used to control the outputs.

-----  
-----  
-----  
-----  
-----  
-----  
-----  
-----

[4]

20 Variables in programs contain specific types of data.

Show the denary number 35 as an 8-bit (unsigned) binary number.

-----  
-----

[1]

END OF QUESTION PAPER

Question			Answer/Indicative content	Marks	Guidance

Question	Answer/Indicative content	Marks	Guidance
8	<p>1 mark for benefit, 1 mark for drawback e.g.</p> <p>Benefits:</p> <ul style="list-style-type: none"> <li>• Variable doesn't need passing as a parameter (byref)</li> <li>• You don't need to return a value</li> <li>• Can be accessed from any function / anywhere in the program</li> </ul> <p>Drawback:</p> <ul style="list-style-type: none"> <li>• Increases memory usage (as it is used until full program execution is over)</li> <li>• Alterations within the function may have unwanted side effects elsewhere in the program.</li> </ul>	2	<p><b><u>Examiner's Comments</u></b></p> <p>Many candidates found it easier to describe a benefit than to give a drawback. The most commonly identified benefit was that the array would have global scope (and would therefore not need to be passed as a parameter), but often the descriptions given were too vague, e.g. 'can be accessed anywhere'. The correct technical vocabulary is required.</p> <p>Drawbacks were poorly described. Potential side effects and resultant complexity debugging were frequently alluded to as 'accidental change' but not fully developed into complete qualified points.</p> <p>There was also a frequent misconception that you cannot have multiple variables with the same name, which is not true. When a local variable is declared with the same name as a global variable that already exists, it takes precedence within the local scope.</p>

Question		Answer/Indicative content	Marks	Guidance
9	a	<p>1 mark per bullet up to a maximum of 3 marks, e.g.:</p> <ul style="list-style-type: none"> <li>• To start from the beginning // first booking slot</li> <li>• Search each slot in order // sequentially</li> <li>• Search until the first empty slot is found</li> </ul>	3 (AO2.2) (3)	<p><b>Examiner's Comments</b></p> <p>This question was generally not well answered. Candidates found it difficult to articulate a clear and concise set of steps that take place during a linear search. Many responses were vague and not directly related to a linear search being performed on the data presented in the table.</p>
	b	<p>1 mark per bullet up to a maximum of 7 marks, e.g.:</p> <ul style="list-style-type: none"> <li>• Defining the <code>findFirst</code> function correctly</li> <li>• Suitable logic for checking the first time slot</li> <li>• Suitable logic for checking the next time slot...</li> <li>• Suitable loop to check all time slots</li> <li>• Suitable logic for returning the available time slot</li> <li>• Suitable logic for returning -1 if no time slots available</li> <li>• Suitable use of variable names and indentation</li> </ul>	7 (AO3.1) (7)	<p><b>Example solution:</b></p> <pre>function findFirst()     count = 0     do         found = false         if customerID[2, count] == "" then             found = true         else             count = count + 1         endif     until count == 10 or found == true     if found == True         return customerID[0,count]     else         return -1     endif endfunction</pre> <p>There are many different ways that this function could have been achieved. Therefore other alternative methods should be given credit.</p> <p><b>Examiner's Comments</b></p> <p>A number of candidates started by defining a procedure rather than defining a function. Indentation was not always consistent with the constructs being used. Candidates seemed to have difficulty with referencing two dimensional structures. Algorithms that require two dimensional data frequently appear on this paper and</p>

Question	Answer/Indicative content	Marks	Guidance
			<p>candidates need to have extensive practical programming experience solving problems using these structures.</p> <p><b>Exemplar 2</b></p> <pre> appointments = [array] FUNCTION FindFirst ()     length = appointments.length()     available = -1     index = 0     found = False     while found == False AND index &lt; length         if appointments [2] == "" then             if appointments [index, 2] == "" then                 print                 available =                 return appointments [index, 0]                 found = True             else                 index = index + 1             endif         endif     endwhile     return available end function </pre> <p>A well-structured pseudocode response that uses indentation and variable naming well. The logic of the loop to check each item in sequence for an empty entry is clear, as is the indexing into the 2-Dimensional table structure.</p> <p><b>Exemplar 3</b></p> <pre> <sup>void?</sup> <del>check</del> appointments if <del>not</del> appointments available, find first appointment available, if <del>not</del> then // if not are available appointments if not print (appointments available / this is the first <del>in</del> appointment) // this prints for first appointment if not no appointments available, return -1 end if end procedure </pre> <p>To contrast with Exemplar 2, this exemplar shows a lack of pseudocode with a response written mostly in prose English, with inconsistent indentation and a lack of clear variable naming.</p>

Question			Answer/Indicative content	Marks	Guidance																														
					 <p><b>Assessment for learning</b></p> <p>Candidates frequently benefit from having extensive practical programming experience when answering pseudocode questions.</p> <p>Past paper questions can provide a context for problems for implementation. For this question candidates could either be asked to code a two dimensional table structure for the data in <b>Fig 1</b> and to then implement the linear search, or they code be provided with a scaffolded partially complete solution with the table defined and the stem of a function given.</p> <p>Routinely taking past paper questions that can be practically implemented is an effective way to make sure that candidates have relevant experience.</p>
