

Wildzer

Have you ever wondered what it is like away from our Solar System? Well now take a step forwards onto a new planet truly out of this world.

Where are you?

Wildzer is in the Fluffed Pug galaxy. Wildzer is in the 'Goldilocks zone,' which means it is not too close to the supernova and not too far away. It takes 666 days for it to orbit. It also takes 36 hours to make a full rotation.

Appearance and Terrain

Wildzer is pink in summer and yellow in spring. It is 222,666 in diameter (which is bigger than Jupiter.) This is the only smooth planet in its Solar System. Surprisingly, Wildzer has: trees; lakes; flowers; and sky blue oceans. It also has a purple ring made of gas and ice.

Calamite and Atmosphere

The temperature in spring is like England and so is summer. Wildzer has the largest known atmosphere! It is sunny in summer and it rains yellow and pink; flowers; apples; and potatoes.

Life on planet

There are knife-lights (which are the only birds with teeth) it eats; Mynellyes; and bark of trees. Mynelleys, which is a killer alien, it eats leaves, flash, grass, apples- all under water grown. It's hard for knife-lights to find Myenlleys because the live under water.

Interesting facts

- It was discovered by Olivia Wildzer 2 weeks ago
- Mercury is very hot. However Wildzer isn't hot
- In 2 million years Wildzer will go into its star and it will explode and the fluffed pug galaxy will be gone forever
- It has two moons iceb233336 and Twirlb2666+xxl
- It only has 2 seasons summer and spring
- Wildzer has...OXYGEN!
