

Planet Shifter

Have you ever wondered what it's like on another planet? Well here you can learn about Planet Shifter. Planet Shifter can be found in the Milky Way Galaxy and is 600 light years away from Earth. It has two moons and orbits a giant Supernova.

Appearance and Terrain

Around Planet Shifter is a purple haze that radiates from the planet which makes it seem purple. Around the planet, it is said that there are grasslands. There are purple ice shards hanging from the top of the mountains which are as sharp as pocket knives. They are very big and could snap off at any moment. In the centre of the planet, there is a big crystal clear lake. At sunset, scientists believe that there are flashing blinding lights from the Supernova.

Climate and atmosphere

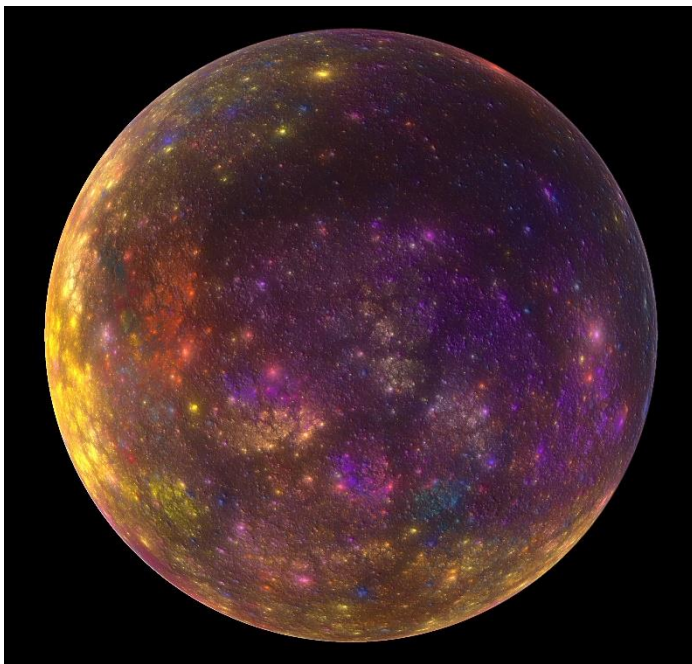

On Planet Shifter, the air is quite easy to breathe in which is why scientists are able to visit Planet Shifter. Amazingly Planet Shifter moves about which changes the atmosphere and weather. This causes the seasons to be messed up. It rains ice because scientists believe it has been seen on the floor melting away.

Life on Planet Shifter

On Planet Shifter there is lots of wildlife consisting of space animals with 3 forms of life. They are known as the dark ones, the novas and friendly ones. Depending where they live, they eat and have different personalities. All of the animals have purple eyes but occasionally have red eyes.

Interesting Facts

- Planet Shifter was found by Professor X
- Planet Shifter is most known for moving about and having lots of different animals
- Scientists believe the animals have been aggressive to people so it's not habitable.
