

Maximus 1993

Have you ever wondered what life is like on a different planet? Well now you will know because we are going on a journey through writing. 3...2...1... BLAST OFF!

Next to Maximus 1993, there is Tranquil Stone – which is the closest to the sun- and Rainbow Retreat is the one not far behind it. Because it is not too far from the sun, but not too close, it means it's in the goldilocks zone. It has two moons that are called Alpha and Twirl. This effects day and night. Maximus 1993 takes 40,000 years to orbit its sun. Sadly, this is not in our Solar System (however it is in Aphmau).

Appearance and Terrain

When you look at Maximus 1993 from afar, it looks like Earth's "brother". Actually, it is made of freezing ice that, you can't melt, and luscious green grass. At night time, on the planet fairies glow and so does the dangerous pool of lava that you could fall in. In the north-west of the planet, there is a "friendly" demon rainbow dragon (who is always hungry). Coming from a water fall, a relaxing river runs through the middle of the planet. Around the core on the planet, there is a small bit of diamond. But it would be extremely hard to get because of the thick layer of ice. Circling the planet, there is a ring made of debris of rock and ice.

Climate and Atmosphere

When one side of Maximus 1993 is tilted towards the sun, it is 23°c and when one side is tilted away from the sun it's 11.5°c. Occasionally, on the planet, it's cloudy because it's tilted on its axis. Around the planet, there is a very thin atmosphere. The climate changes rarely.

Life on the planet

Roaming on the planet, are pastel colour aliens that leave a trail of slime behind them. Because they like the texture of clear glue, they eat crunchy clear slime. At night time, the aliens stay awake which means they are nocturnal. Inside their "houses" there are fairy lights, bunkbeds and all types of slime.

In the "friendly" forest, there is a demon rainbow dragon, which terrifies everything in its path,. In reality, all he wants is a hug. He wants this because he feels lonely in the forest.

Interesting facts

- It was discovered on the 20th September 1993 hence the name.
- It was discovered by Max Paul.
- Gravity is weak but everything that lives there sticks to the ground.
- It is 50n light years away from Earth (294 trillion years).
- The diameter is 5000km

Thank you for reading my non-chronological report on Maximus 1993.
