

Progression across Year 5 and 6

	Working towards	Secure (End of Year 6 expectation)	Beyond
Scientific enquiry and questioning	<ul style="list-style-type: none"> • Questioning Ask questions to develop a deeper understanding about scientific concepts. • Scientific vocabulary Begin to use scientific vocabulary within questions and answers. Identify ways to investigate enquiries. 	<ul style="list-style-type: none"> • Relevant questions Ask relevant questions, using scientific vocabulary, to extend learning. • Scientific enquiry Confidently identify a range of enquiries to solve a question, selecting the most appropriate. Inform new enquiries by identifying and using scientific evidence. 	<ul style="list-style-type: none"> • Develop enquiry Begin to ask questions to develop a line of enquiry based on observations, prior experience and scientific concepts. • Generate questions Generate questions from the results of an investigation.
Variable identification and understanding (planning)	<ul style="list-style-type: none"> • Variable understanding Understand and explain why variable control is important (how this has an effect on an enquiry). • Variable identification Begin to identify which variables need to stay the same and which need to change. • Key components Identify the key components of an investigation <i>e.g. prediction, method, fair test, results.</i> 	<ul style="list-style-type: none"> • Planning an enquiry Plan different types of scientific enquiries to answer questions. • Recognise and control variables Identify when control is necessary and the impact of variables. • Repeating investigations Identify the necessity to repeat investigations to increase accuracy, identifying anomalies. • Technical vocabulary Use vocabulary such as variable and constant and relate this to investigations. 	<ul style="list-style-type: none"> • Scientific technical vocabulary Confidently use scientific, technical vocabulary such as variable and constant to explain investigations. • Explain Explain why variables and constants have been chosen if there were more than one variable.
Predictions	<ul style="list-style-type: none"> • Patterns Inform predictions by recognising patterns, similarities and differences between observations. • Reasoning Make simple reasoning comments by using prior knowledge. 	<ul style="list-style-type: none"> • Informed predictions Make informed predictions when setting up further investigations in new contexts. • Secure understanding Use understanding of scientific concepts to justify and provide reasoning for predictions. 	<ul style="list-style-type: none"> • Explaining Explain and provide reasoning for predictions using previous knowledge, scientific vocabulary and terminology.
Observations and measurements	<ul style="list-style-type: none"> • Scientific vocabulary Use some scientific vocabulary to show an emerging understanding of a concept. • Measure accurately Use a range of devices, not always able to select the most appropriate. 	<ul style="list-style-type: none"> • Accurate precise measurement Take measurements, using a range of scientific equipment, with increasing accuracy and precision. • Appropriate selection of measure. Identify when appropriate to repeat readings. • Explain observations using scientific vocabulary and show clear reasoning. 	<ul style="list-style-type: none"> • Recognise reliability Consider and comment on measure reliability and impact on results. • Improvement Comment on measure improvement to directly impact results. • Interpretation Begin to interpret observations and patterns.
Recording	<ul style="list-style-type: none"> • Simple vocabulary Record findings using simple scientific vocabulary, appropriate to the context. • Present data in a chart, graph, table or diagram. 	<ul style="list-style-type: none"> • Scientific diagrams with increasing complexity <i>e.g. diagrams and labels, classification keys, tables, scatter graphs, bar and line graphs</i> appropriate to the results. • Appropriate recording Identify appropriate method and when repeat readings are necessary. 	<ul style="list-style-type: none"> • Accurate recording in a range of different ways, making comparisons between recording techniques. • Organise and interpret Confidently organise and interpret recordings, justifying chosen method.
Classifying and presenting	<ul style="list-style-type: none"> • Classify and present data in different ways to provide evidence to answer a scientific question (not necessarily the most appropriate). • Simple presentation with basic scientific language. 	<ul style="list-style-type: none"> • Present and classify findings, conclusions, causal relationships and explanations in a range of different ways. • Degree of trust Identify patterns and explain these using correct terminology. 	<ul style="list-style-type: none"> • Accurate techniques Make comparisons between data- using tables, charts and graphs as evidence. • Identify patterns and confidently explain why they have occurred.
Conclusions	<ul style="list-style-type: none"> • Simple comparisons Compare variables using simple sentences and comparison vocabulary <i>e.g. the heavier the weight, the greater the stretch.</i> 	<ul style="list-style-type: none"> • Explain Use prior knowledge, correct terminology and evidence to explain findings, using diagrams to support where necessary. • Identify uncertainties Recognise uncertainties due to variables and control. Identify possible errors and provide reasoning. 	<ul style="list-style-type: none"> • Adapt to create precision Independently identify possible errors. Adapt experiments to produce more precise conclusions.
