Light waves are transverse waves and can be reflected and refracted.

- Reflection** of light can be shown when light reflects at a plane mirror and forms an image. This can be represented by a ray diagram like the
- Refraction** of light can be shown when light is passed through a glass slab at an angle to its normal. When a light enters a more optically dense medium, the angle of incidence (the angle between the incident ray and the normal) is greater than the angle of refraction (the angle between the refracted ray and the normal). The opposite is true when light enters a less optically dense medium.

Snell's law relates the angle of incidence and the angle of refraction to the refractive index of a medium by

$$n = \frac{\sin i}{\sin r}$$

where i is the angle of incidence and r is the angle of refraction.
