

An aerial photograph of a winter mountain resort. The foreground is filled with a dense forest of evergreen trees heavily laden with snow. In the middle ground, a ski resort town is visible, featuring several large, multi-story buildings with snow-covered roofs and ski tracks winding through the landscape. The background shows more snow-covered mountains under a cloudy sky. The overall tone is cool and wintry, with a blueish-grey color palette.

Holy Family Ski Trip December 2026

Sestriere

Drop off arrangements

- Drop off at school likely to be 4am and will be confirmed closer to the time.
- Drive in entrance closest to Aldi and onto the back car park
- Walk into main school hall to register, hand in passport, money and medication.

HIGHER ELEVATION. BIGGER CHALLENGES. ALTITUDE SICKNESS.

(IT'S REAL — EVEN WHEN YOU'RE SKIING)

Altitude sickness happens when your body struggles to adjust to less oxygen at higher elevations. It can affect anyone — including you, even if you're fit and love the slopes.

SAME YOU.
JUST HIGHER.

HIGHER
ELEVATION
= LESS
OXYGEN

COMMON SYMPTOMS

(CAN START 6–24 HOURS AFTER ARRIVAL)

Headache
(most common)

Nausea
(or loss of appetite)

Fatigue
(feeling unusually tired or weak)

Dizziness
(feeling off balance)

Trouble sleeping
(even when you're exhausted)

Shortness of breath
(especially with activity)

WHO'S AT HIGHER RISK?

Higher elevations
(usually above 8,000 ft / 2,400 m, but it can start lower)

Going up too fast
(your body needs time to adjust)

Hard physical activity
(skiing, hiking, etc.)

Dehydration
(less fluid = harder for your body to adapt)

No prior experience
(it can happen to anyone, especially on your first trip)

HOW TO PREVENT IT

TAKE IT SLOW

Give your body 1–2 days to adjust if you're going to a high-altitude resort.

STAY HYDRATED

Drink water regularly — even if you don't feel thirsty.

EAT WELL

Fuel your body with carbs and avoid excessive alcohol.

LISTEN TO YOUR BODY

If you feel off, rest and avoid pushing harder.

- You could be skiing for 4-5 hours every day - which is tough going for anyone. In order to make sure you can hack this, you'll need to work on your cardiovascular fitness. And the best way to do this is through aerobic exercise.
- Aerobic exercise is pretty much any exercise that raises your heart rate. So why not take up running or cycling? Cycling is extremely popular among professional snow sports athletes, as it's one of the most similar activities to skiing in terms of the stresses on the body.
- Running is great exercise (particularly if you want to lose a bit of weight at the same time) and, of course, it's great if you're on a budget or low on time - you could run around your local park or neighbourhood and save on the gym membership! The only downside to running is that, as it is high impact, it can damage knees.
- If you are planning on heading down the gym then, as well as the exercise bike and treadmill, hop on the cross-trainer too! Another great aerobic exercise, it's also low impact (so kinder to the knees) and can break up that endurance training nicely.
- You should really be aiming to work out three times per week, for up to an hour per session. You can expect to really start to notice a difference in your endurance fitness within about six weeks.

GET SKI-READY!

FUN EXERCISES FOR A SAFE AND EXCITING SKI TRIP

The Next Generation In School Ski Travel

- When skiing, you're going to need to be able to rely on your muscles - in particular, your quads and glutes.
- The quadriceps are the muscles at the front of your thighs. They're important for skiing because they're what you'll use to bend your knees.
- There are a number of exercises you can use to build these muscles up, including squats, lunges and leg presses. Ideally, you should start building up your quads at least 12 weeks before your ski trip. Trust us, you'll definitely notice the difference if you do!
- The glutes, or gluteal muscles, are those around the buttocks and hips. Skiing and snowboarding both require a huge amount of external hip rotation, so it's important that you build up these muscles too. Again, there's loads of exercises you can try - squats, lunges, deadlifts and step ups are all great. And if you're a bit bored of those, why not give kickboxing a try?
- You'll also want to work on your core strength and stability, especially if you're planning on venturing off-piste at any point during your trip. A strong core can also help increase your speed and will improve your stance, taking some of the pressure off of your back. Some great exercises to work on your core include oblique crunches and planks.

FLEXIBILITY FOR SKIERS

- Our top tip for increasing your flexibility is to get stretching! Yes, stretching is important before and after exercise, but you can also do a little bit of stretching here and there throughout the day, independently of exercise. This will lengthen your muscles and tendons, which in turn should help with avoiding injury.
- It's particularly important to stretch those leg muscles - including your hamstring, inner and outer thighs, calves and quads - as it's these that will take the most pounding when you get out on to the slopes.

FLEXIBILITY: PREVENT INJURIES WITH STRETCHING!

QUAD STRETCH

HAMSTRING STRETCH

HIP OPENERS

ENDURANCE: KEEP UP THE ENERGY!

RUNNING

JUMP ROPE

CYCLING

YOU'RE READY TO HIT THE SLOPES!
