

No true placenta, usually have a pouch

Mammals – a warm-blooded animal. Mothers produce milk to feed their babies.

Has a placenta to exchange nutrients

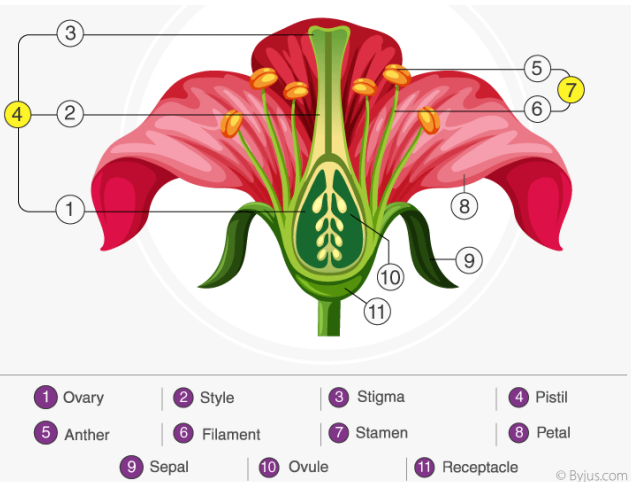

Lay eggs & feed their babies with milk.

How are the life cycles of plants, a mammal, an amphibian, an insect and a bird the same?

Parts of a flower and their function

Pollinate – to move or carry pollen to a plant, causing the seeds to be fertilized
Reproduce – to have young or offspring
Asexual reproduction – requires only one parent and does not involve mating.
Sexual reproduction – requires two parents

How new plants are created

Sexual Reproduction Asexual Reproduction

Threats faced by chimpanzees

Jane Goodall

Insects

Amphibians

Amphibian – spends part of its life cycle in water and part on land. Hatch in water and breathe with gills. Cold-blooded
Metamorphosis – the changes in form of some living things as they grow

Life Cycles
