

The Ultimate Predator

The SIRAFIDILE

Introduction

The sirafidile was made by a giraffe connected to a snake and a crocodile. It was made by a human dropping a mysterious glue, sticking them together.

The animal's Features

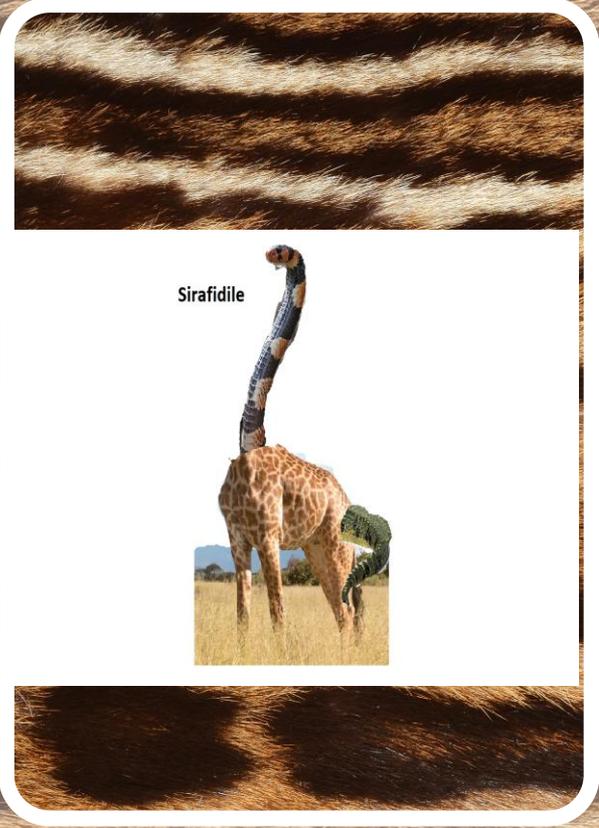

This animal has orangey black snake as a head a giraffe's body and a crocodile's tail. You must be thinking how did the snake get glued onto the giraffe when the giraffe had a head and a crocodile tail? The snake simply ate the giraffe's head with the crocodile trying to eat the giraffe but getting its body stuck.

Habitat

This creature lives in the Savannah. This climate is exceptionally hot which suits the snakes head and the crocodile tail. At night it sleeps by sleeping under trees for shelter. It put leaves where it sleeps to make its bed comfy.

Diet

The Sirafidile is an omnivore it eats leaves of trees (like giraffes). They also eat deer, scorpion and meerkats. To hunt deer they tuck their bendy snake heads behind its body and the crocodile tail so the deer think it's a headless giraffe quickly, it spreads into action.
