Livyatan Diet

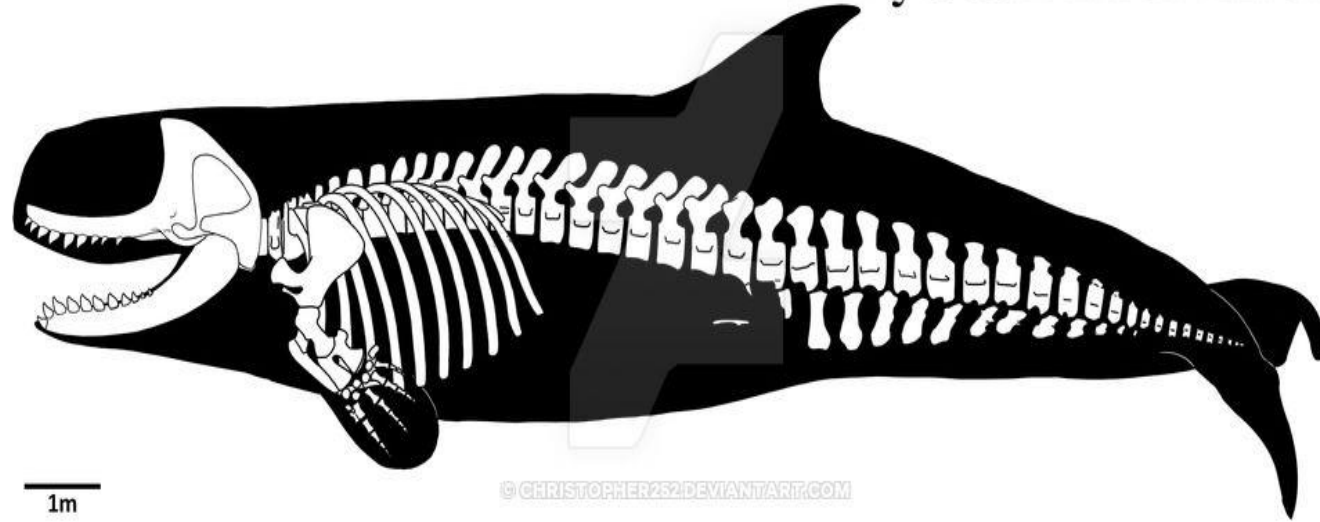

Livyatan Diet

- **Livyatan** was at the very top of the food chain and it must have needed a lot of food. While modern sperm whales mainly eat squid, Lambert thinks that **Livyatan** used its fearsome teeth to kill its own kind – the giant baleen whales.

13.5

The total length of adult **Livyatan** is estimated to have been about 13.5 m (44 ft) when using the modern sperm whale for scaling, and 16.2–17.5 m (53–57 ft) when using the raptorial *Zygophyseter* for scaling; scaling achieved by measuring the head-to-body ratios.
