

## What should I already know?

- Animals can be grouped into vertebrates (and then further into fish, reptiles, amphibians, birds and mammals) and invertebrates
- Some examples of life cycles (including those of plants and humans)
- The processes of dispersal, fertilisation and germination
- Reproduction is one of the seven life processes.
- Parts of a plant, their features and what their functions are.
- The work of David Attenborough.
- The word metamorphic means 'a change of form' (in the context of rocks)

## Living Things & Habitats What will I know by the end of this unit?

What will I know by the end of the unit?	
What is reproduction?	<ul style="list-style-type: none"> <li>• <b>Reproduction</b> is when an animal or plant produces one or more individuals similar to itself: <ul style="list-style-type: none"> <li>• <b>Sexual reproduction:</b> <ul style="list-style-type: none"> <li>• requires two parents with <b>male and female gametes (cells)</b></li> <li>• will produce <b>offspring</b> that is similar to but not identical to the parent</li> </ul> </li> <li>• <b>Asexual reproduction:</b> <ul style="list-style-type: none"> <li>• will produce <b>offspring</b> that is identical to the parent</li> <li>• requires only one parent</li> </ul> </li> </ul> </li> </ul>
How do plants reproduce?	 <ul style="list-style-type: none"> <li>• <b>Male gametes</b> can be found in the <b>pollen</b>.</li> <li>• <b>Female gametes</b> can be found in the <b>ovary</b> (they are called <b>ovules</b>).</li> <li>• <b>Pollination</b> occurs when <b>pollen</b> from the <b>anther</b> is transferred to the <b>stigma</b> by bees and other insects.</li> <li>• The <b>pollen</b> then travels down and meets the <b>ovule</b>. When this happens, <b>seeds</b> are formed - this is called <b>fertilisation</b>.</li> <li>• <b>Seeds</b> are then <b>dispersed</b> so that <b>germination</b> can begin again.</li> <li>• Some <b>plants</b>, such as daffodils and potatoes, can also produce <b>offspring</b> using <b>asexual reproduction</b></li> </ul>
What are examples of life cycles?	<ul style="list-style-type: none"> <li>• The <b>life cycles</b> of mammals, birds, amphibians and insects have similarities and differences.</li> <li>• One difference is that amphibians and insects go through the process of <b>metamorphosis</b>. This is when the structure of their bodies changes significantly as they grow (for example, from tadpole to frog or caterpillar to butterfly).</li> </ul>

## Vocabulary

**Anther** - the part of a stamen that produces and releases the pollen

**bulb** - a root shaped like an onion that grows into a flower or plant

**cell** - the smallest part of an animal or plant that is able to function independently

**dissect** - dispersed, scattered, separated, or spread through a large area

**dissect** - to carefully cut something up in order to examine it

**scientifically** -

**embryo** - an unborn animal or human being in the very early stages of development

**fertilisation** - male and female gametes meet to form an embryo or seed

**flower** - the part of a plant which is often brightly coloured and grows at the end of a stem

**flowering trees or plants** - which produce flowers

**function** - a useful thing that something does

**gamete** - the name for the two types of male and female cell that join together to make a new creature

**germination** - if a seed germinates or if it is germinated, it starts to grow

**life cycle** - the series of changes that an animal or plant passes through from the beginning of its life until its death

**mature** - When something matures, it is fully developed

**metamorphosis** - a person or thing develops and changes into something completely different

**ovary** - a female organ which produces eggs

**ovule** - a small egg

**petal** - thin coloured or white parts which form part of the flower

**plant** - a living thing that grows in the earth and has a stem, leaves, and roots

**pollen** - a fine powder produced by flowers. It fertilises other flowers of the same species so that they produce seeds

**pollination** - To pollinate a plant or tree means to fertilise it with pollen. This is often done by insects

**reproduction** - when an animal or plant produces one or more individuals similar to itself

**seed** - the small, hard part from which a new plant grows

**stigma** - the top of the centre part of a flower which takes in pollen

**structure** - the way in which something is built or made

### Scientific enquiry

- Dissect a flower and identify the different parts of it. Label the different parts and explain their functions.
- Grow new plants from different parts of the parent plant, for example, seeds, stem and root cuttings, tubers, bulbs.
- Compare the life cycles of mammals, amphibians, insects and birds. What is similar about their life cycles? What is different?
- Observe life cycle changes in a variety of living things, for example, plants in the vegetable garden or flower border, and animals in the local environment.
- Compare the life cycles of plants and animals in the local environment with other plants and animals (in the rainforest, in the oceans, in desert areas and in prehistoric times), asking pertinent questions and suggesting reasons for similarities and differences.
- Observe changes in an animal over a period of time (for example, by hatching and rearing chicks), comparing how different animals reproduce and grow.
