

Subtracting Fractions

- Look at the following bar. It shows $\frac{5}{6} - \frac{2}{6} = \frac{3}{6}$

- Write the calculations to match the following bars.

$$\frac{\quad}{5} - \frac{\quad}{5} = \frac{\quad}{5}$$

$$\frac{\quad}{7} - \frac{\quad}{7} = \frac{\quad}{7}$$

$$\frac{\quad}{\quad} - \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} - \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

Subtracting Fractions

- Draw your own bars to represent the following calculations, then calculate the answers.

1. $\frac{6}{7} - \frac{2}{7} = \text{---}$

2. $\frac{5}{9} - \frac{3}{9} = \text{---}$

3. $\frac{3}{4} - \frac{1}{4} = \text{---}$

4. $\frac{9}{10} - \frac{5}{10} = \text{---}$

- Draw a bar to represent $\text{---} - \text{---} = \frac{1}{8}$. How many different bars are there to show this calculation?
