

Observing over time

Pupils observe, identify and measure events and changes in living things, materials and physical processes or events. These observations may take place over time spans of minutes or hours up to several weeks or months.

Observing over time could help you to answer questions like...

- What changes occur to a bird chick after it hatches?
- How do the colour of leaves change through the seasons?
- How does the volume of water in a container on the windowsill change with time?
- How does the height of our cress plants change with time?
- How does my shadow change over the day?

What will you ask?

What will you find out?

How will you record your findings?
