SS: I can write to explain.

### How are rocks formed?

Did you know that the rock you hold could have been held by a cave man? Your house is probably made out of a man made rock. If you want to know more about rocks, read on.

Magma comes out of the earth and becomes lava and when that cools it becomes an igneous rock.

Sediment comes off igneous rocks and goes into the sea. Layer upon layer and pressure squeezes the water out making them sedimentary rocks.

When igneous rocks meet with sedimentary rocks they go back in the ground and with extreme heat and pressure it will make metamorphic rocks.

Next time you see a rock. Appreciate it!
