

## Fossil Formation: Structured Research Task

Statement	True	False	Don't Know	Scientific evidence I have found to prove the statement true or false (remember diagrams can support your theories)
A person who studies fossils is known as an archaeologist.				
Animal fossils are the remains of bones which have been buried.				
All animals which die, and are left in the open, will eventually be fossilised.				
Fossils are formed in any type of rock.				
Fossils are formed because water, containing minerals, seeps into the bones and replaces the chemicals.				
Fossils have been found on every continent on Earth
