

Nuclear power

Storing the toxic waste is a major problem	Nuclear power plants are very expensive to build – the new Hinkley Point plant could cost £18 billion	High cost to build electricity
Old plants have to be decommission which is expensive	Construction of new plants provides jobs	There is a risk of radioactive leaks
	Waste water can harm local ecosystems	

Wind farms

High construction costs	Visual impact on the landscape	Lower energy bills
Reduced carbon footprint	Negative impact on local economy as tourism can reduce	The turbines make a lot of noise
Construction can harm the environment due to the road access and land area required		However, some wind farms attract visitors
