

1. Ad-hoc networks are commonly used in large organisation LANs.
 - True
 - False

2. What is tethering?
 - Where a connection between a device and a central access point, such as a router, is made in order to access the internet
 - Where a smartphone is connected to by another device in order to make use of its mobile broadband connection.
 - A public wi-fi hotspot that can be found in many places like restaurants, cafés and hotels, typically not requiring a password to access.
 - A network of multiple devices within the personal area of an individual used to share files between devices.

3. Why might data be less secure when stored using cloud services?
 - Data is stored outside the UK, which is always less secure.
 - Data is accessible online, so someone could hack the cloud storage account and steal the data.
 - Cloud service providers will rarely implement good security procedures.
 - It isn't the data is always more secure.
