

B

One-step problems In each problem the cup (a) can be worth a different amount.

Record an equation for each scale and solve it.

Match the bar model to an equation. Then find the value of y .

$$y + 27 = 72$$

$$3y = 72$$

$$72 = 47 + y$$

Two-step problems An equation is represented below.

$$2b + 1 = 5$$

-1

-1

$$2b = 4$$

÷2

÷2

$$b = 2$$

Use this process to solve the equations below. You don't have to draw the pictures, but you do need to record each step (above right).

5 $3y + 7 = 16$

6 $49 = 7a + 7$

7 $0.5 + 5c = 18$

8 This is an example of an equation represented by a bar model. Write the different algebraic steps shown by the bar model.

Use the bar models method to solve the equations below:

9 $97 = 4b + 5$

10 $3f + 65 = 116$

Use your preferred method to solve the problems below:

11 $6a + 5a + 12 - 5 = 139$

12 $7d + 18 = 116$

13 $4c + 20 + c - 9 = 76$

14 $9d - 12 = 60$
